MEMORANDUM

Mr. Wiegand

St. Louis, Mo.
January 31, 1940

Subject: AROCLOR 5460

As requested in our telephone conversation of today, I have examined the eight crystallization test samples which you sent over to me.

According to my observations, Nos. 1, 8, M-3, M-4, M-6 and the blank are all alike. They contain a few undissolved particles, but I find no evidence of the typical crystals such as were present in the W. P. Fuller Lacquer and which caused the inauguration of this crystallizing test.

Samples No. 18 and No. M-5 were alike. These contained more and larger crystals than the other samples.

In my opinion--which may not be so good since I have not been actively following this matter and examining materials regularly but which I wish to express anyway--all of these materials are satisfactory for shipment.

A. Kirkpatrick
