TO : E. P. Wheeler - EWHEE

Attached is an application for toxicity study of Aroclor 6037. This formulation will replace Aroclor 1242 at a particular customer (Radiator Specialty Company) for use in automatic transmission fluid additive applications. Principal use involves the market for transmission seal swell additives where the customer will pour the contents of 6 or 8 ounce cans or bottles into his transmission to slow or stop seal leakage.

This fluid is almost identical to Aroclor 6040 being marketed for plasticizer applications in place of Aroclor 1242. You may already have sufficient toxicity information on hand to characterize this product. Please let us know if further information is needed.
