Subject: Dust Collection - Joint Cement Manufacturing - Akron, New York Gypsum Plant

Dear John:

Confirming our phone conversation on May 9, 1973, please be advised that you are authorized to complete the final engineering work for the above subject.

I have reviewed Mr. Harvey's suggestion concerning the possibility of moving the existing Wheelabrator dust collector indoors in order to reduce the duct length and recycle the collected material. The idea has some good merits; however, the Akron Plant manufactures a variety of joint cement products and recycling the collected dust would result in contamination from one product into another product. For this reason, I prefer to increase the Wheelabrator fan size to handle the additional C.F.M.

The submission of the required forms and drawings to the State of New York and Erie County for approval will be handled by this office; therefore, I would appreciate receiving the original tracings as soon as they have been completed. Also, upon completion of the drawings, you should submit a formal quotation to this office and the Akron Plant for furnishing and installing the necessary dust handling equipment. The electrical installation will be handled by the Akron Plant.

Sincerely,

George Turner
Project Engineer
Gypsum Division
