M. E. Gibbs - Res. 1

Your comments concerning sections 3.0.1 and 3.6.1 of the risk analysis for the Aroclor Expansion are most pertinent and certainly appreciated. Since the Risk Analysis was issued, the analytical requirements for the start-up have been determined, and the same situation which you discussed also became apparent to us here at the plant.

Currently our AR&D section is developing a routine method for $FeCl_3$ determination. We plan to monitor the catalyst concentration once each shift not only in the mix tank and #6 chlorinator, but in #7, 8 and 9 chlorinators also.

Any additional comments you may have at any time on control of the Aroclor process at WGK will always be welcomed.

H. F. Ray
