(Whereupon, slides were presented to the jury.)

(Whereupon, the witness left the witness stand.)

Q I would like to show you a chest X-ray for Mr. Keith Grewe previously marked as Grewe Number 24-C, chest X-ray for North Arundel Hospital dated May 18, 1993.

Is that an appearance that is consistent or typical of an individual with pleural mesothelioma?

A It is. What you basically see on the right side here is relatively normal with -- the lung tissue showing up is black because it doesn't have much density because of all of the air, and the right side here would be obscured by this density here which could be that it is fluid there causing this density or could be a combination of fluid or tumor that is completely opacifying this left side of the chest or could be all tumors.

Q Now, at that time in May of 1993 at North Arundel there was a thoracentesis attempted?
