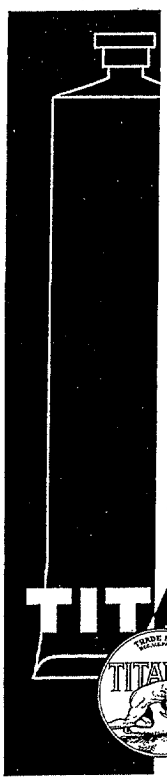
"Blanket the stock"

say printers...

That means inks must have greater hiding power!



● When the printer demands inks that must completely cover the stock...when the color must spread evenly without objectionable spottiness...that's when inkmakers appreciate Titanox-B. • Titanox-B offers you the following superior properties: (1) chemical stability and inertness; (2) exceptional opacity; (3) unusual brightness; (4) fine particle size; (5) good hiding qualities. These properties are particularly valuable in making light-colored inks to be used over large areas. • Chemically inert, Titanox-B won't react with other ink ingredients and cause spottiness or muddy tints. • Let us work with you in improving your inks. Write today for further information.
