6:00 p.m.	"Environmentalists say the Monsanto Company's decision to stop producing the cancer producing substance PCP is a step in the right direction. But they say neither that nor the new toxic substances control bill not---on the President's desk will solve the long range problem of contamination by PCBs. In Washington George Groce asked what the new bill will do. "PCBs, specifically, it means that after a period of roughly two years, they will no longer be able to manufacture PCBs. Now Monsanto has said that it probably won't manufacture PCBs next year. What it fails to do is to really address the major question, which is, we have 1.4 billion of PCBs that have been produced since the beginning of production 34 years ago. And a large amount of that---over half of it---is still out in service in the environment apparently. And the question is how is that going to be disposed of?"
