Re Vermiculite Paper - P.S. #505

We have confirmed an earlier report that the basic material in the above product contains a trace amount of tremolite, which is an asbestiform mineral. Conversation with the vendor indicates that he has taken only one airborne sampling at the slitting and rewinding operation in his plant. This sampling indicates a detectable level of asbestos fiber in the air.

As you know, according to the regulations, any detectable fiber means that we are bound to conduct medical surveillance and maintain medical records on all exposed employees, for a period of 20 years after they no longer work in the asbestos exposure job. It is necessary then that we do a monitoring during the processing of this raw material, both at the CORBESTOS-inline, and at the swaging operation on the second floor in plant 2. These areas may be considered to be the most likely to create dust from the facing, and should tell us whether or not we have the potential for requiring surveillance.

Please arrange to have me notified in advance of such manufacturing processing, so that equipment can be properly prepared and I can come in and do the necessary airborne monitoring.

Thank you for your cooperation.
