Dear Rogers: RE: INF SURVEY

I am enclosing a condensation of the survey. I have met with Dr. Braun since our last Q.A.M.A. meeting at Sherbrooke. We have endeavoured to reach a "condensation" for publication, avoiding references to the so-called method of reporting or classifying "tuberculosis" at our clinics. In fact the epidemiological survey is one conducted for the purpose of determining the cancer incidence in asbestos workers (and not in workers necessarily suffering from "asbestosis").

The present figures and data as to smoking habits are explained on page 18 (bottom) and conclusions in that connection, however, have been avoided.

Inasmuch as Dr. Braun will be severing his connection with INF on January 1st next your comments, if any, should be forwarded to me at an early date.

Yours,

Faithfully yours,

IVAN SABOURIN
