

There's just a particle of difference between Oncor® S25 and other anti-corrosive pigments.

*(And that
means a lot.)*

If you make a metal-protective gloss enamel, Oncor® S25 Basic Lead Silico Chromate pigment can help make your life a lot easier. Oncor S25, with its 4-micron pigment particle size, will save you work, time and money. It's easy to disperse in anti-corrosive formulations. And it helps give your customer what he's looking for — gloss enamel with exceptional rust-fighting properties. If you're involved in electro-deposition or dipping primers, Oncor S25's unique suspension characteristics can help you here, too. You'd have to look pretty close to see our Oncor S25 particles. But you'll have no trouble in seeing the advantages when you start using it.

Want to know more about this versatile member of the Oncor family? Ask your National Lead representative or write for spec sheet. National Lead Company, Room 4111, 111 Broadway, New York, New York 10006.
