Asbestos Dust

Note new regulations with my notes attached
This is a health problem & not a nuisance dust
As I see it we should

A. Contact your present respirator supplier & see if he can recommend an industrial hygienist to do our testing. (The test equipment is pink approx (2) inches square and (2) inches high. Ken (W. only knows of (2) models to Ken

B. Test Honeycomb, M-67 & MCB panel fab & assembly areas.

C. Use the proper respirators as used in areas over 5 fiber/milliliter.

D. Before you design & build Proj 5-2353 for Honeycomb scrap disposal, wait until we get new regulations. Note what checked scrap of asbestos waste & scrap.

Keep us advised as we can be of help in getting this solved. I put a few fibers on Tennessee over & we have sent in other cases. We will see what new regulations depict

Peter Bill looked at test equipment at Mat Eng. Shows to trap dust on counter — Sampler can then be examined (count of fibers) at any period for a month — like a smoky stope to work. Later
