"Like liquid
porcelain"

THE HOME OF QUALITY PRODUCTS

FOREWORD

To speak of the plant of **Harrison Bros. & Co., Inc.** "The Home of Quality Products" is no idle boast.

For over a century this "House" has taken a firm stand against misbranding and misrepresentation, and the name "**Harrison**" on a label has always been a guarantee of absolute honest quality. This Company was the first to place the full analyses of paints and colors upon the package label. Even with formulas made public, however we are beyond successful competition from those who lack the **Harrison experience** of more than a hundred years and are without our exceptional facilities for safe-guarding the quality of raw material and finished products.

To a considerable extent the reputation of **Harrison products** is due to the fact that **Harrisons** are manufacturers "from the ground up." We make not only the finished paints and colors, dry colors and pigments (which are the average manufacturer's raw materials) but we draw from our own mines and chemical factories, materials from which other manufacturers' raw materials are made. Thus we exercise through every step of manufacture "from the ground up" the watchful care and selection which produces **Harrison quality**.

The present works, located at the historic Grays Ferry of the Schuylkill are almost a small city in themselves. They comprise over seventy factories, fully equipped for the production of a wide range of chemical and paint products, employing a force outnumbering the inhabitants of the average town.

There is a central power plant and electric light and power station, large enough to supply a good sized city. We have our own water works with five miles of high pressure mains, connected with powerful fire pumps, also private fire fighting department; machine shop, carpenter shop, cooperage, supply store, private restaurant, etc. The Harrison Laboratory group consists of fully equipped chemical and physical testing, biological, industrial and experimental laboratories. The Summer School course given by our Laboratory Department is attended by picked students from the larger universities. We have a telephone exchange as large as the average town and our own telegraph office with private wire direct to our office in New York, and with direct connections to outside Philadelphia telegraph and cable offices. A large combination stable-garage houses our numerous teams and auto-trucks. We have inside our fence two miles of standard gauge railway tracks, connecting with main trunk lines, also a fully equipped narrow-gauge inter-factory system connecting the various factories, docks and central shipping stations. There is nearly a mile of water frontage, with docks on deep water where ocean liners load and discharge their freights. Our Publishing Department, with its Printing Office, fully equipped to produce anything from big posters to the finest art color work; its Sample Painting and Color Card Making Department is constantly turning out new features for the trade.

The Harrison Mining Department, with mines in the West and South for the production of sulphur, aluminum ore, lead, zinc, barium sulphate ores, pigments, etc., supplies many of the raw materials for the Philadelphia plant.

The health and recreation of employees is not forgotten. Our Medical and Accident Prevention Department is constantly minimizing the danger of accident. Employees receive free medical treatment at their homes. Shower baths and rest rooms are provided at the factories, also an athletic field with base ball diamond and tennis courts for sole use of the company's employees.
