The process streams to the Vinyl II Plant thermal oxidizer consist of heavy ends from distillations of ethylene dichloride and vinyl chloride monomer. The feeds to the above processes do not contain sulfur, lead, or mercury.

Small amounts of ethylene dichloride, chloroform, methanol, and pyridine are also treated in the thermal oxidizer. Likewise, these feeds contain no sulfur, lead, or mercury.

All feeds to the thermal oxidizer are derived from on-site process streams.

A.S. Baker
