#### RESPIRATOR PROGRAM

Respirators are furnished to employees by the Company for their use in those areas in the Plant where dusty conditions exist from time to time. It is the responsibility of the employee to keep this respirator clean and free from damage. It is also the responsibility of the employee to wear this respirator when conditions so dictate.

Respirators, when not in use, will be stored in the cabinets furnished by the Company. After each use, the employee will be responsible for cleaning his respirator and replacing the filter. The respirator will then be placed back in the storage cabinet.

When defective parts of the respirator are found, it should be turned in to Mr. John Huegel. Replacement filters are also available from Mr. Huegel.

#### CARE & MAINTENANCE

When resistance to breathing becomes uncomfortable, it is a sign that the filter has served its useful life and should be replaced. To replace filter, proceed as follows:

1. Depress latch on bottom of respirator and pivot cover away from body until top locking lug on cover disengages from slot in body.
2. Remove and discard the used filter.
3. Wash respirator in warm, soapy water and dry.
4. Place a new filter over ribs on body making sure the filter flange is inserted into the body sealing cavity around the entire periphery.
5. Replace cover by hooking the top locking lug into the slot in the top of the body and pivot the cover down over the new filter and into the sealing cavity around the periphery of the body. Press cover and body together until cover latch engages in body slots and locks.
6. Observe exposed edge of filter at bottom of respirator for adequate seal.

Periodically, Mr. Huegel will replace respirators with ones that have been cleaned and sanitized.
