Interim Comment 9/27/75 Trask & Garrett re-writing (ccs to Button HSB)

In July you asked me to prepare some information concerning personal protective equipment to be used in handling PCB's as they were considered materially more toxic than they have been considered in the past.

My recommendations in this case would be principally based on control of skin exposure in the manufacture of capacitors and in maintenance workers performing maintenance on transformers. In respect to air analysis, I would recommend exposures be limited to 0.5 mg/M^3 or the consequent action level of 0.25 mg/M^3.

If you want these recommendations written out in some type of format for inclusion in a report, would you contact me on how this should be done.

Jack
