Dear Sir:

I just recently did a lot of construct in my home using Georgia Pacific - Ready Mix Joint Compound, Lot # 9306T11702. I didn't notice on the label till after I was completed that the material contained asbestoes fiber which constituted a serious health hazard.

In sanding the Ready Mix Joint Compound on the new sheet rock I installed, I got this fine dust all over my home.

My questions are as follows: 1- How much (percentage) asbestoes fiber is in your Joint Compound? 2- Is the amount in your Joint Compound (fiber) really harmi 3- Is there asbestoes fiber in sheet rock 4- Any other information you might have on this subject I would appreciate

your sending to me.

I have small children that were living in our home while I was remodeling and I am concerned about their welfare. I have heard that since 1973, The Environmental Protection Agency has banned materials containing more than 1% asbestoes fiber.

I would appreciate hearing from you. Also if you have any information on asbestoes fiber and it's use in various building materials, I would like a copy.

Thanks For Your Time,

Craig Bunningham
