

LINE: SILVERLINE WATER PUMPS

PRODUCT: WATER PUMPS

---

DIFFERENCES vs PREMIUM: Following disassembly, cleaning and inspection all castings in the Silverline water pump line are checked for bearing bore dimension. New seals are installed. New or regrooved bearings and shafts are installed as required. Each unit is then vacuum tested to insure that no leakage occurs at seals, bearings, and castings.

As Professional Quality water pumps are assembled all casting bearing bores are checked with a go/no-go gauge for dimensions. Salvaged hubs and impeller bores are checked with an air gauge to insure proper press fit. 100% new bearings, shafts and utilized seals are installed. An anaerobic compound is used during seal installation to insure a 100% metal-to-metal seal. Testing of the Professional Quality line is similar to the Silverline series.
