

1 back in January was located.

2 I don't know if this abnormality was due to
3 metastatic cancer or whether it was due to the chest
4 tube presence with the tumor involving that area as
5 the consequence of what had been there before.

6 Q Do your notes reflect that there were any
7 other tests that were performed on him for this
8 hospital stay?

9 A He had a CAT scan done of the upper abdomen
10 which -- and the right lung which showed the right
11 lung mass.

12 There was thickening of the right pleura
13 with loculation of fluid and there were these nodular
14 densities seen in the lung.

15 He also had some arterial blood gases
16 obtained which were to be evaluated for the amount of
17 oxygen that he was getting.

18 His oxygen level was what we call 56.2,
19 which was in the lower range of just barely adequate
20 at that time. Most people would give oxygen to a
21 person at this level.
