OBJECTIVE:

Determine status of Olympic talc.

SUMMARY:

Olympic talc has been given bacteria approval and it is going in for asbestos and bulk density as well as particle size testing. Colgate seems extremely interested in going to our Olympic talc especially because we can handle a lot of the lab work concerning asbestos which they are having sent out to McCrone in Chicago right now. HTM agreed to run certain asbestos tests (he agreed to discuss running these tests), after getting approval. At our meeting a timetable was set up and Frank Marshner is to get back to me in a week or two to obtain a 50# bag of Olympic and then they will go ahead and proceed to get together a panel test to determine if it would hurt going to our material vs the material they are presently using from Charles Mathieu. It was also mentioned during our meeting that they found some tremolite in their other talc source and this has really gotten them up in arms. Things look good here and I will await a call from Frank Marshner.

this was not
in your report
& maybe
overlooked.*

DETAILS:

During our meeting HTM agreed to send to Karl Shumway a geological survey of our mine in Montana and also HTM offered to have them visit our Montana operation. Apparently they are using more than the 1,000 Tons that Margaret Lewis in New York mentioned. It looks from here to be more like 2,000 tons at both locations. Colgate is very impressed with our capabilities from a lab standpoint and I think this is our biggest selling point at this time.
