AOB	SEPA mentioned an issue firefighting foam & a building that proved unable to “contain” the escape of firefighting foam, (pathway) to an external impact. Installations need to check containment of foam, and corresponding phase out dates. Other aspects of foam - how do you dispose of wash water etc? Also future is a shift towards fluorine free firefighting foam (see Last Fire presentation above).	SEPA / LM to check whether more detail can be circulated on this incident (at this time).
