Gentlemen: Att: Mr. R. J. Marler.

In reply to your letter of February 25th, 1932, re: Remus Holmes, Serial # 771, Group 1052, Raybestos Manhattan Inc.

In your letter you asked to be advised as to whether there were any signs or symptoms of pulmonary tuberculosis in this case. I have had sputum examinations made on this case and they have all been negative.

Since being confined to his home, he has had influenza and has recently developed a large carbuncle on his back. It is quite possible that this man has some fibrosis due to his occupation.

Since repeated examinations of sputum have been reported negative, for tuberculi and I have not had this man X-rayed, I am unable to make a diagnosis of pulmonary tuberculosis.

The fibrosis noted above has no reference to his disability at this time.

Yours very truly,

WWW:L
