...AND HEALTHFUL ALL YEAR 'ROUND

The owners of Eagle insulated homes have discovered a very interesting fact: most of them are saving money on doctor bills, since insulation was installed. There are several reasons for this increase in good health.

First—because the house insulated with Eagle is cool during hot weather, normal restful sleep is regularly enjoyed by every member of the family. There is a noticeable absence of fatigue, and a corresponding increase in bodily resistance. Sickness does not get started so easily.

Second—During the heating season the house insulated with Eagle is comparatively free from drafts and cold floors. These two conditions breed colds, particularly among small children. The thick layer of Eagle insulation stops the cold wind from filtering through the walls to create drafts inside. It allows the heating plant to warm every part of every room, banishing cold floors and making the floors safe and comfortable for children's play.

Third—In wintertime, the house insulated with Eagle is quickly warmed to the comfort level, and the temperature is easily kept at the comfort level all day long. In an uninsulated house, the heating plant must frequently be forced to capacity because much of the heat it generates goes straight through the walls and roof to heat all outdoors. Then, when the house finally does get warm, the heating has such a head start that a period of uncomfortable *overheating* must be endured. Thus, a zig-zag of underheating and overheating is set up, and frequently continues throughout the day. Public health studies in New York City schools show that this uneven indoor temperature often results in colds, which may lead to more serious respiratory diseases. But when Eagle insulation keeps the heat inside where it belongs, such an unhealthful temperature condition is avoided because the house warms evenly and quickly, and response to control of the heating plant is immediate and positive.
