Monsanto Chemical Company
Organics Division
800 N. Lindbergh Blvd.
St. Louis, Missouri 63141

Gentlemen:

We would appreciate receiving samples of your various Arochlors (chlorinated polyphenyls) to be used in our laboratory in the enforcement of the Federal Insecticide, Fungicide and Rodenticide Act (as amended). In addition we would also like to have any literature you may have concerning these materials as well as Analytical methods if they are available.

If there is a charge for any or all of these, please submit the bill with the material and we will initiate payment immediately on receipt of the shipment.

Thank you for your attention to this matter.

Sincerely yours,

W. N. Blickenstaff

Beltsville, Maryland 20705

Dear Mr. Blickenstaff:

I enclose our technical bulletin O/PL-306. This describes the physical and chemical characteristics of our 12 Aroclors. Do you want samples of all of them and what size sample are you desirous of obtaining? I presume what you want is the technical Aroclor material as sold.

Could you explain to me your interest in Aroclors. Especially in relationship to the enforcement of the Federal Insecticide, Fungicide and Rodenticide Act. Are Aroclors used in applications that come under this act?

Sincerely,

R. Emmet Kelly, M. D.
Medical Director

March 6, 1968

Dr. R. Emmet Kelly, Medical Director
Monsanto Company
Medical Department, Mail Zone 001
800 North Lindbergh Boulevard
St. Louis, Missouri 63166

Dear Dr. Kelly:

This will acknowledge receipt of your technical bulletin O/PL-306 and your letter of February 29, 1968.

Our interest in Arochlors stems from recommendations made on page 36 of the above named technical bulletin. Since our organization is directly responsible for the analysis of pesticide formulations under the FIFRA, we desire samples of the various arochlors to use in identity tests and comparison tests when such formulations are analyzed.

You are correct in assuming that we would be interested in the material as it is sold commercially. We are interested in obtaining about 3 ounces of all of the available arochlors. If there is any charge for these, please bill us at the time of shipment and we will initiate payment upon receipt of samples.

Thank you for your consideration.

Sincerely yours,

W N Blickenstaff

United States Dept. of Agriculture
Pesticides Regulation Division
101 South Laboratory Building, A.R.C.
Beltsville, Maryland 20705

Dear Mr. Blickenstaff:

I have forwarded your letter to Mr. Ken Wells, of our Organic Division, and I am sure you will be hearing from him shortly.

It is true that at quite some time in the past one of the Arochlors was used as a volatilization retarder for some insecticides. Lindane was the only one and I am really not sure how widespread this use was. For all I know, it may not be used anymore; although, certainly, it could be used without our knowledge. We do not, however, have any direct knowledge of its use.

Sincerely,

R. Emmet Kelly, M. D.
Medical Director

SUBJECT: AROCLORS/
USDA INVESTIGATION

REFERENCE:

TO: Dr. R. Emmet Kelly
Medical

I refer to your letter of March 6 to Mr. Blickenstaff of USDA in Beltsville, Maryland. It is interesting to note that his interest in Aroclors stems on recommendations on page 36 of our technical bulletin O/PL-306. I am sure he is referring to our recommendations on vapor suppression. In fact, our recommendations are based on those of the USDA scientists at Beltsville, Md.

Our bulletin CS-6, issued in March, 1961, gives full details of the researches and recommendations given by the USDA workers which appeared to have been carried out for a period of years starting as early as 1954. I wonder if a new breed has arisen at Beltsville which is unfamiliar with the work of their predecessors. Do you think it would be worthwhile sending bulletin CS-6 to Mr. Blickenstaff.

Beltsville, Maryland 20705

Dear Mr. Blickenstaff:

It appears that the use of Monsanto Aroclor resin as an ingredient in insecticide formulations was based on U.S.D.A. work. I had not realized this when I wrote you earlier.

I am sending you a copy of our data sheet that refers more specifically to it.

I hope by now you have received the samples and if you have not, please let me know.

Sincerely,

R. Emmet Kelly, M. D.

CHEMICAL SPECIALTIES DATA REPORT

The information in this report was compiled to assist you in your evaluation and development of special uses for Monsanto products. Every effort has been made to include pertinent material bearing on the subject. This information is intended to guide your development work, but Monsanto cannot take part in the specific formulation or evaluation of any finished product... since knowledge of such should be reserved to yourself and is often your most valuable trade secret.

No. CS-6
Date March, 1961

MONSANTO AROCLOR* RESINS FOR INSECTICIDE FORMULATIONS

A Discovery

A simple method of increasing the service life of expensive lindane sprays was developed several years ago by U. S. Department of Agriculture scientists at their Beltsville, Maryland, testing station. The technique was to incorporate Monsanto's "Aroclor" 5460, a resinous chlorinated terphenyl in the lindane solution. This pale yellow solid reduces volatility of the lindane -- slows it down to an effective, but not wasteful, evaporation rate. The result is an insecticide deposit on treated surfaces that lasts up to ten times longer than that left by straight lindane solutions.

Normally, simple solutions of lindane leave a crystalline residue that dissipates within a few weeks. On hard surfaces such as glass, metal or painted areas, the residues last only about a week. Because lindane is a well established and effective pesticide, U.S.D.A. researchers sought a way to improve the lasting qualities of lindane residues. Of numerous compounds tested, "Aroclor" 5460 gave the best results at lowest cost.

Test Work

A major objective of these studies was to develop a suitable formulation for application to crops and other plants. Although results under carefully controlled conditions were quite promising, subsequent tests by other agricultural experimenters gave only moderate success. Consequently, interest has been slow to develop in agricultural circles. Apparently, the vagaries of sunlight, weather, and plant growth represent too many variables for effective study of the formulation residues by direct application to exposed plants.

Furthermore, nothing contained herein shall be construed as a recommendation to use any product in conflict with existing patents covering any material or its use.

AD 76

TOWOLDMON0003267
WATER_PCB-00000289

A New Idea

But another possibility for putting the U.S.D.A. discovery to work has lain dormant until recently; this is the possibility of using to good advantage the ability of "Aroclor" resins to make the lindane adhere to smooth hard surfaces like metal, glass, painted areas, etc. This would consist of painting or spraying "Aroclor"/lindane formulations on such areas as the inside of garbage can lids, on window screens, doorsills, the painted walls of outbuildings, dairy plants, storage areas, etc., in order to obtain lasting control of flies, ants, roaches, silverfish and other troublesome pests. Suitable formulations can be readily packaged in shoe-polish type "dauber" bottles, aerosol spray cans, and bulk packages for mechanical spray application. Development of this idea is based on the following:

Advantages of Using "Aroclor" Resins in Insecticide Formulations

* A suitable "Aroclor" (Monsanto makes seven) can remarkably extend the effective life of lindane and other chlorinated insecticides as much as ten times (up to 2 and 3 months).

* "Aroclor" resins are very low in cost (around 20¢/lb.).

* Small quantities are sufficient (5 to 25 parts per hundred, by weight).

* Formulation is extremely simple -- the resin is dissolved in a suitable solvent compatible with the insecticide.

* Stable in inventory and in insecticide formulation. "Aroclor" resins are fire-resistant, non-oxidizable, non-corrosive, withstand weather extremely well.

* Non-staining "Aroclor"/insecticide films formed when the solutions dry are practically invisible. "Aroclor" 5460 has a pale yellow color as supplied. Other suitable "Aroclor" products are nearly colorless.

* "Aroclor" resins are odorless -- won't impart "chemical" odors.

* "Aroclor" resins are safe to handle as long as they are not volatilized and inhaled. They are practically non-volatile at ordinary temperatures, do not irritate or sensitize normal skin.

* The nature of the residue can be varied. Monsanto supplies a variety of "Aroclor" resins. These are chlorinated to various degrees and vary in physical properties as follows:

MON-MT-008585

TOWOLDMON0003268
WATER_PCB-00000290

Chlorinated Terphenyls

Aroclor 5460 - Yellow, transparent, friable solid (dries hard)
Aroclor 5442 - Yellow, transparent, sticky semi-solid (dries tacky)
Aroclor 4465 - Yellow, transparent, brittle resin (dries sticky)

Chlorinated Biphenyls

Aroclor 1262 - Light yellow, sticky, viscous semi-solid (dries stick
Aroclor 1260 - Pale yellow, soft, sticky semi-solid (dries sticky)
Aroclor 1254 - Pale yellow, viscous oil (dries "wet")

Experimental Work and Formulations

The following information was derived from preliminary reports on work done by U.S.D.A. research groups. These data are not to be construed as recommendations by either the U.S.D.A. or Monsanto, but rather are intended to serve as a guide or starting point for the development of private formulations.

Fifty to 200 milligrams of lindane per square foot of surface has given good insect control on nonporous surfaces. The ratio of lindane to "Aroclor" 5460 has been varied from 1:1 to 1:4. For most purposes a 1:1 or a 1:2 mixture is satisfactory.

Formulations as used in the U.S.D.A. experiments are:

1) For application as a solution.

Lindane	5 parts by weight
"Aroclor" 5460	5 parts by weight
Carbon Tetrachloride	750 parts by weight

(Carbon tetrachloride is toxic and should be handled with extreme caution. Less toxic solvents are easily obtained.)

2) For application as an emulsion.

Lindane	20 parts by weight
"Aroclor" 5460	20 parts by weight
Xylene	100 parts by weight
"Triton" X-100 (available from Rohm & Haas)	3 parts by weight

To obtain a stable 1% lindane emulsion, mix 1 part by weight of the above concentrate to 13 parts by weight of water.

MON-MT-008586

TOWOLDMON0003269
WATER_PCB-00000291

3) For use as a pressurized (aerosol type) spray.

a)	Lindane	5 parts by weight
	"Aroclor" 5460	5 parts by weight
	Methylene chloride	40 parts by weight
	"Freon" 12 (DuPont)	50 parts by weight
b)	Lindane	5 parts by weight
	"Aroclor" 5460	5 parts by weight
	Cyclohexanone	10 parts by weight
	Ortho-dichlorobenzene	35 parts by weight
	"Freon" 12 (DuPont)	45 parts by weight

Experimental Results - American Roaches

Using Formula 3a or 3b, the toxicant was applied onto a painted wall, depositing about 200 mg./sq. ft. of lindane and a like amount of "Aroclor" 5460.

When the toxicant coat was one month old, it gave 90-100% kill of American roaches when the roaches contained in a petri dish were placed against the surface of the treated wall for two hours.

The U.S.D.A. research team found that the lindane-"Aroclor" 5460 mixture (used at the rate of 50 mg. of actual lindane per sq. ft.) would kill 80% of all cockroaches exposed for 2 hours to a 60-day-old treated surface. It remained lethal to 66% of the roaches after 90 days. Regular lindane sprays used at the same rate killed only 4% of the roaches after 60 days.

Results with Houseflies

Deposits of 25 mg. of lindane plus 25 mg. of "Aroclor" 5460 applied from carbon tetrachloride onto glass and aluminum (hard surfaces) gave 100% kill of normal houseflies exposed for 2 hours to these treated surfaces after they had aged 18 weeks, the duration of the test.

Without the "Aroclor" the hard surfaces treated with lindane alone were effective only about a week.

A lindane plus "Aroclor" mixture sprayed as an aerosol onto leaves of a willow tree continued to kill houseflies after 2 months of outdoor weathering. Careful inspection of the treated leaves showed that the toxicant was held firmly to the surface and notwithstanding rain and weather, the coating remained in good condition. Also, within limits of a preliminary inspection there seemed to be no injury to the willow leaves.

MON-MT-008587

TOWOLDMON0003270
WATER_PCB-00000292

(Note: The primary purpose of this report is to provide information for the development of suitable insecticide formulations for application to "nonsensitive" surfaces such as metals, glass, paints, and other materials that will not be damaged by the application. Development of formulations for living plants requires sufficient test work to insure that the formulations will not be injurious to the plants or their products.)

Another Formulation Reported

A more recent development in these experiments is the following simple formulation:

"Aroclor" 5460	25%
Lindane	25%
Methylethyl Ketone (MEK)	50%

Work on this was reported in the August 14, 1954 issue of Chemical Week magazine.

This simple formulation appears to be most suitable for "painted on" formulations packaged in bottles but should be used with caution in mechanical spray equipment since the MEK solvent will soften rubber and certain plastics. The formulation could also be modified easily for aerosol packaging.

Since MEK evaporates rapidly, it should not seriously affect painted areas unless too heavy applications are made. The package label should include a caution to this effect. Also, MEK is flammable. Possible substitutes that are less flammable are methylchloroform or a mixture of methylchloroform and methylene chloride.

Formulating Other Insecticides

The beneficial effects of "Aroclor" 5460 apply generally to other chlorinated insecticides including chlordane, aldrin and dieldrin, but do not apply to phosphate type insecticides such as TEPP, parathion, methylparathion, malathion and chlorothion.

* * * *
