F. F. Squibb Fluorochemicals

Attached is an article appearing in The Wall Street Journal of October 15 concerning Fluorochemicals. Because of the possibility of some of these products withstanding temperature of 1000° F., and in view of the high cost even on a large scale production, it may be that Lithopone would find a use as an extender or pigment. Certainly something else besides the common organic filler would have to be used for such temperatures.

Inasmuch as your division contacts Minnesota Mining, I thought you may wish to keep an eye on the possibility of developing the use of Lithopone for some of these fluorochemicals.
