

MAKES YOUR HOME COMFORTABLE IN SUMMER

The thick, fireproof layer of Eagle Home Insulation blown into the walls and roof of your house turns back the sun's scorching heat and keeps your home cool and comfortable on hot summer days and nights.

You see, this insulation stops the passage of heat. That means that it stops heat from coming *into* your house in the summertime just as effectively as it stops heat from going out of the house in winter. The result is true comfort, even during the worst of summer.

Those scorching, sultry midsummer days have little effect on the family living in an Eagle-insulated home. Thermometer records kept in homes insulated with Eagle show up to 15° temperature differential between inside and outside readings. Probably the finest summertime benefit of this insulation is the restful sleep you enjoy. Every bedroom is more comfortable—even the one which was unbearably stifling. How many times you have wished for such comfort! Priceless though it seems, it is yours the minute Eagle insulation guards your home.
