Four samples of scrapings and haylage were analyzed for PCBs. Sample #1 labeled silo-new 1972 scrapings and haylage were below the sensitivity of the method of 0.5 ppm. The samples marked #2 silo-old scrapings and haylage were contaminated. The scrapings from the old silo measured 0.79 ppm and the sample of old haylage contained 19 ppm. This identifies sample #2 from the old silo as a source of PCB contamination and a course of action should be taken to remove this silo as a source of contamination to animals. It is recommended that you inform the owner that assistance in solving husbandry and management problems can be obtained through you as the County Agricultural Agent and through the various extension specialist at Purdue.
