SABINITE* PLASTER *absorbs noise*

Like a dry sponge soaks up water . . . SABINITE absorbs noise and reduces reverberation. That's why SABINITE is specified and used for so many jobs.

SABINITE is an acoustical plaster finish applied with the usual plasterer's tools by any skilled plaster craftsman. It is made in two types—either trowel or float finish. When SABINITE is used, you do the job—this opens up the big acoustical market and means more work for you.

SABINITE, the leader in acoustical plaster, is not only used on new work but due to its light weight it can also be applied over approved existing ceilings. We will be glad to furnish details covering this method of application. This will develop an additional market for the plastering trade.

A new booklet on SABINITE with complete directions for use is now available. A copy will be sent to you at your request.

*SABINITE used above is a registered trademark which distinguishes the acoustical plaster manufactured only by the United States Gypsum Company.
