FROM: Henry Ruby
Toms River, New Jersey

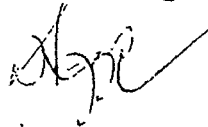

Dear Julius:

The air sampling test was made by the mixer while making a mix of Ready-Mixed Joint Cement at the time he dropped in the asbestos and while it was being mixed in with the other ingredients.

The dust collection unit was operating but I don't remember as to whether or not the vibrator was running.

When the #2 line is running, they shut off the air to the vibrator because it deprives the #2 line of its required air. However I usually put the vibrator on at 4:PM and let it run until I leave.

Thanks & regards
