Hydrogen, helium, and air cylinders are piped from R6 to Labs 2228, 2231, and 2232. These cylinders supply the chromatographs and are in use where needed. Hydrogen is not used in Labs 2231 and 2232 as the chromatographs are thermoconductivity at present.

CO at 80 psig is usually used in Lab 2107, however at present it is not in use. Line is disconnected and plugged at the cylinder.

CO at 1500 psig and ethane at 50 psig are piped in to Lab 1207 and are in use.

Note: Two plant lines, contents unknown, are blocked in in this lab. These lines pre-date acetic acid work; may be ethylene, ethane, or HCl. These lines will be removed from the lab.

Six cylinder manifolds of high pressure CO into Lab 2232 were disconnected and manifold was blocked in.
