WBR

Reponded to a number of questions concerning the June 8 news release on OSHA's detection of dioxin in the chlorophenol unit at Krummrich. All were answered from the prepared Q&A.

Reporter was told specifically that our analysis of a recent product sample did not indicate the presence of 2,3,7,8 dioxin.

My understanding is we can analyze to 10ppb for total dioxins. STATEMENT ABOVE IS TRUE but perhaps misleading in talking < 10ppb.
