The 18" Bauer Mill was secured and installed upon your recommendation. You proposed that dust should be dry milled if possible. That is the way the mill was installed. It was tried last week and found that the voids in plate filled and the flow of dust from weigh hopper stopped. We can have feed lines altered and run dust and water through it, still holding at .008 setting. Our ultimate objective now is to reduce asbestos by a portion of glass fiber introduction. Why should all of your original planning be changed? However, if you have valid reasons based on findings later than April 1961, when this program was set up, will be glad to discuss and if necessary have the plant make the necessary piping changes.
