R. Kodras — October 23, 1967

Greenie Jackson — WCRF Section

This letter presents the following information.

1. J 5145 Niacin: 10% Rabbit Study
The ACCD-33 is not fit to 3.3 mg/kg. Immediately put two or three subpregnant does on test using 3.3 mg/kg for a total of seven doses. Observe for signs of cutbreak. Obtain body weight and approximate feed consumption data.

2. J 5314 Niacin: 4 Replicate Study
Sacrifice the second litter and terminate the study on November 1, 1967 after the chicks from the first hatch have been observed for 30 days.

3. J 5345 Abbott Erythromycin Third Succinate Study
Sacrifice pups at 10 months of age on November 15, 1967.

4. J 5393 and J 5395 Niacin Polygram and Filler Study
Send down this week; to vet on October 30, 1967.

5. J 5376 Choline Chloride Injured Chicks
Continue study until we have enough chicks.

6. J 5674 Chromium Tris Study
Rerun three pens that died at the 20 mg/kg level. Set up next test groups at the 10 mg/kg level. Notify me if does lose weight.

7. J 5432 Chevron Cotton Dye Study
Sacrifice one bird from each pen and have necropsyed and send down the rest of the carcasses. For the 22 pens to be necropsyed on 10/27/67 use the lateral and ventrolateral views. The ventrolateral view should be taken in two sections, the anterior and posterior halves (for the head and neck halves). Use a marker that will make a permanent record on the radiograph. Also the kodak films need a more thorough washing.
