Subject: Vermiculite Ore - Asbestos Monitoring - 92075

Date: September 10, 1980

Attached is the report from McCrone Associates on the various vermiculite ore samples submitted July 22, 1980. A vermiculite sand and Turf Builder sample were also submitted. A more descriptive sample identification and calculated percent actinolite is included. The percent asbestos calculated is based on the total of all fractions. The (?) under x-ray diffraction for four samples designated as amphibole detected indicates that the background is slightly higher at the point actinolite would be detected and should not be considered a definite indication. The next set of ore samples will be submitted in October 1980.
