

April 9, 1927.

Dr. W. E. Duell,
E. I. DuPont de Nemours Co.,
Dye Works Hospital,
Pennsgrove, N. J.

My dear Doctor Duell:

I am sending you herewith the analytical results which we obtained on the specimens which you sent. These are tabulated in such a way as to make comparison with former results.

There is nothing in these results which indicates any considerable amount of danger to the person concerned. There is definite evidence of lead absorption, and what concerns me somewhat is the fact that in most cases there is evidence of a gradual increase in lead excretion, which means a corresponding increase in absorption. For this reason I think we should take warning, and keep a very sharp eye out.

I shall expect to see you some time within the next few weeks and look over the situation, especially in the smelting area. I believe that even now these facts should be brought to the attention of the management in order that they may make all haste in bringing about the completion of changes which have been contemplated for some time.

I should appreciate very much receiving the histories and physical examination in the cases of the last six men on whom I have no records. With kindest regards.

Very truly yours,
