Re: The Fate of Inhaled Particulate Lead Compounds

Dear Mrs. Agnew:

The work which is being carried out in the Laboratory is no longer supported by N.I.H. funds. This was terminated last November 1967. The work still goes on with the support of the original industrial sponsors.

I would not consent to any account of this work, or of any publicity, as being under the sponsorship of N.I.H. Neither is there any useful purpose to be served by publicising the work at this time. There may be some fireworks at the time of its publication, and if so, that would be the time for publicity, but not for its initiation here.

Robert A. Kehoe, M.D.

RE The fate of inhaled particulate lead compounds

Our contact in the Features Section of the National Institutes of Health has asked us to suggest ideas for picture stories about our NIH-supported research. For those stories the NIH decides would be usable, a photographer will be sent from Bethesda, Md. The results will be distributed to publications throughout the nation.. We have already had some success with this Section -- for instance, Dr. Ralph Scott's use of data-phone equipment in his orthogonal electrocardiogram research.

At this time we are contacting everyone on the current NIH grant list to ask if each of you will think of your research in terms of photography. Almost every project has the possibility of at least one good picture of some facet of the work; most will have a number of picture possibilities. I will appreciate hearing your suggestions for your research and hope you will write them down or call me at 872-5676.
