Subject: Information on Washington Works Facility

I received this today. We need to discuss pulling this info together. I assume George can provide a copy of the NPDES permit and the recent discharge data (we both have). I'm in DC on Thursday, but in Friday.

Subject: Information on Washington Works Facility

Andrew - I would appreciate if you could provide me with the following information.

could you provide me with the information on the approximate amount of C-8 that leaves the facility through the waste water treatment plant (under NPDES) vs the amount that goes out as part of the noncontact cooling water (I believe that you provided some numbers on this during my plant visit and indicated that the majority of the C-8 is from the Teflon process and goes out through the treatment plant). Also, is the C-8 monitored as a requirement under NPDES, or is it something that DuPont monitors for its own information. do you have analytical results from the plant discharge of the untreated noncontact cooling water. If so, may I see a copy of the most recent results for all parameters that you analyze for. may I have a copy of the facilities NPDES permit(s), or at least the portions of the permit(s) that would indicate the frequency of sampling and what you are required to analyze for. Also, may I have a copy of your most recent NPDES analytical results.

the RFI Report indicated that you sampled potable well number 336 during the RFI. Could you please provide me with the most recent analytical results from all of the potable wells found on-site.

the DuPont-Lubeck well field represents the old Lubeck Municipal Water Supply Wells, that are now used as part of DuPont's production wells (groundwater capture system) - correct?

could you provide me with a copy of the most recent analytical results for all of the on-site production wells.

Thank you for your help. Bill.
