ASBESTOS MONITORING PERSONNEL METHANOL SHUTDOWN
CONDUCTED BY D.A. GADDY. (APE INSULATION REMOVAL)

I discussed the two samples with Don before he departed. We agreed that levels of exposure were satisfactory since respiratory protection was used. He believed Sample 1 was very well taken, but Sample 2 was suspect. Reason for Sample 2, no supervision while handling samples etal. I talked to Haskell yesterday and confirmed error in calculation of fiber count on Sample 2 instead of 2.85 fiber/cc it should be 4.99 fibers/cc. The error was in the total volume of air sampled. All this is noted in datebook but you should review with Manson Fourcican (B & B Insulation). If you need any additional info I will be glad to review for you. Call me if you have any questions (DUCOM 727-9529).

Thanks for your assistance on this.
