PPARK

Attached is a page from Food Chemical News of July 20, 1970, reference to the above subject.

This adoption of "administration guideline levels" does not constitute a FDA regulation. It is, however, a basis for FDA regional offices and state food laboratories whether in departments of health or agriculture to seize and destroy (or declare unfit for human consumption) fish and milk which contain levels of PCB's above 5 ppm and 0.2 ppm respectively.
