Department of Health, Education and Welfare
Food and Drug Administration
Washington, D. C. 20204

Dear Dr. Shapiro:

Vol. 32,
461-473
(1975) →

I recently came across an article in Toxicology and Applied Pharmacology which described the marked differences in the biological effects of Aroclor 1016 and Aroclor 1242. In your evaluation of tolerance levels for PCBs, I thought that you would be interested in this paper. I have attached a copy in the event you had not seen it.

I have also attached a copy of an older report which describes residue levels of PCBs in test animals and appears to support the Monsanto study which I had sent to you earlier.

I hope these papers are interesting and useful.

Sincerely,

W. B. Papageorge
Manager, Product Acceptability
Specialty & Process Chemicals
