Subject: Dust Samples, Asbestos Evaluation - Sheldon Road Plant

Reference: Your Letter Dated September 9, 1982

Your referenced communication has been reviewed with the appropriate Sheldon Road Plant management. As stated in your letter, our current plans are still to use the vacated area for the storage of inactive records and furniture. There are no plans, current or forecasted, to have employes occupy or work in the vacated mix room area.

A proposal to completely remove all asbestos was evaluated in May, 1981 and the costs based on actual quotes, PIR 33-075870, was $61,500. It was management's decision, at that time, to relocate the maintenance area which was located in the vacated mix room area, remove the contaminated ventilation duct work and other miscellaneous work to eliminate the potential of employe exposure to asbestos dust. The above work was completed during the Third Quarter of 1981.

As your tests indicate, airborne concentrations of asbestos have not been demonstrated at significant levels and are not probable. It is our decision, with current economics, not to proceed with any additional work in the area.

If you have any questions or require any additional information, contact Jim Tennant.
